## ANIMAL STANDARD OPERATING PROCEDURE

### Carboplatin

| Animal Safety Protocol designation | • CSL-2  
| • Agent may be excreted by the animals within the first 24 hours post injection therefore the lab must change the bedding 24 hours after administration  
| • See investigator responsibilities below |

| Investigator Responsibility | • Research staff must inform Animal Care staff ahead of time of agent that will be used, and arrangements will be made for housing of animals.  
| • Fresh micro-isolator caging will be used for the animals at the time of administration.  
| • **Danger Sign** must be posted on the door of the room in which the animals will be housed while experiments are in progress.  
| • Cages will be labeled with a pink card with the following information:  
| - Name of agent delivered to animal  
| - Approximate dose  
| - Date of administration  
| - Date of bedding change  
| • Cards and door signs must be removed by the researcher once the hazard is no longer present. |

| Entry requirements | • All Personal Protective Equipment (PPE) gown, gloves, face mask, shoe covers and cap must be worn to enter animal room.  
| • Hands must be washed upon exiting animal room.  
| • Surgical masks, goggles, faceshields or use of a Biological Safety Cabinet (BSC) are required when conducting research. |

| Cage Change | • Animal waste and contaminated bedding shall be handled to minimize generation of dust and aerosols.  
| • Items potentially contaminated with agent will be bagged using red biohazard bags prior to removal from the animal room.  
| • Contaminated bedding must be emptied from cages using a dump station or Class II biosafety cabinet.  
| • If local ventilation controls are not available for opening cages or dumping bedding, an N-95 respirator or PAPR must be worn |

| Decontamination and Spill Procedure | • Empty cages will be sanitized by standard IAS practices  
| • If a spill occurs, all traffic to the area will be immediately restricted and 10% freshly prepared bleach or appropriate disinfectant will be used for clean up. Care will be taken to minimize aerosols during the clean-up process.  
| • Equipment and work surfaces must be routinely cleaned with 10% freshly prepared bleach or appropriate disinfectant. All equipment must be decontaminated prior to removal from the room housing the infected animals. |
